### **CLAIMS**

1	1. An apparatus for identifying and quantifying components in an effluent				
2	stream from an ammoxidation reactor, comprising:				
3	a microprocessor; and				
4	a Fourier Transform infrared spectrometer having a sample cell through				
5	which may flow a portion of said effluent stream, an infrared source to emit infrared				
6	radiation and pass said infrared radiation through said effluent stream, an infrared				
7	detector to detect transmitted infrared radiation at selected infrared wavelengths				
8	and to generate absorbance data due to absorbance of said infrared radiation by				
9	said components, wherein each of said components absorbs infrared radiation at				
10	one or more of said infrared wavelengths, and an output apparatus to provide said				
11	absorbance data to said microprocessor;				
12	wherein said microprocessor is programmed to identify and quantify each of				
13	said plurality of components based upon said absorbance data and calibration				
14	data, said calibration data being obtained from recovery run analyses and				
15	calibration analyses in said sample cell.				
1	2. An apparatus as in claim 1, further comprising a memory device				
2	available to the microprocessor for storing said calibration data for each of the				
3	plurality of components.				
1	3. An apparatus as in claim 1, further comprising an output device for				

outputting quantitative data for each of said plurality of components.

communicating with said ammoxidation reactor and said output device and adapted to adjust and control operation of said ammoxidation reactor based on said quantitative data.

An apparatus as in claim 3, further comprising a reactor controller

4

4.

2

1

3

5.

2	one or more of reactor temperature, reactor internal pressure, feed of air, feed of				
3	hydrocarbon and feed of ammonia.				
1	6. An apparatus as in claim 5, wherein said reactor controller is				
2	controlled by said microprocessor.				
1	7. An apparatus as in claim 1, further comprising a display for displaying				
2 data input to and output from said microprocessor.					
1	8. An apparatus as in claim 2, wherein said calibration data provided to				
2	said memory device has been obtained from effluents from said ammoxidation				
3	reactor				
1	9. An apparatus as in claim 1, wherein said ammoxidation reactor is				
2	operated to produce acrylonitrile.				
1	<ol> <li>A method for identifying and quantifying components in an effluent</li> </ol>				
2	stream from an ammoxidation reactor, comprising:				
3	<ul><li>(A) advancing a portion of said effluent stream through a sample cell in</li></ul>				
4	a Fourier Transform infrared spectrometer;				
5	(B) scanning said portion in said sample cell with infrared energy at a				
6	plurality of infrared wavelengths, wherein each of said components absorbs said				
7	infrared energy at one or more of said plurality of selected wavelengths;				
8	(C) detecting said infrared radiation passing through said sample cell and				
9	generating absorbance data for each of said components; and				
10	(D) quantifying each of said components by comparing said absorbance				
11	data to a calibration curve for each component in a microprocessor programmed				
12	to quantify each of said components.				

An apparatus as in claim 4, wherein said reactor controller controls

11.

1

2	results for each of said plurality of components.				
1	12. A method as in claim 11, wherein said quantitative data is output to				
2	a reactor controller communicating with said ammoxidation reactor and said reactor				
3	controller is adapted to adjust and control operation of said ammoxidation reactor				
4	based on said quantitative data.				
1 .	13. A method as in claim 12, wherein said reactor controller is controlled				
2	by said microprocessor.				
1	14. A method as in claim 12, wherein said reactor controller controls one				
2	or more of reactor temperature, reactor internal pressure, feed of air, feed of				
3	hydrocarbon and feed of ammonia.				
1	15. A method as in claim 10, further comprising displaying data input to				
and output from said microprocessor.					
1 -	16. A method as in claim 10, wherein said calibration curve is calculated				
2	from calibration data obtained by performing on effluents from said ammoxidation				
3	reactor recovery run analyses and calibration analyses in said sample cell, said				
4	calibration analyses performed using steps (A), (B) and (C)				
1	17. A method as in claim 10, wherein said ammoxidation reactor is				
2	operated to produce acrylonitrile.				
1	18. A method for controlling operation of an ammoxidation reactor based				
2	upon real-time quantitative analysis of components in an effluent stream from said				
3	ammoxidation reactor, comprising:				

A method as in claim 10, further comprising outputting quantitative

20.

results for each of said plurality of components.

1 2

4	(a) preparing a calibration curve for each of said components by				
5	analyzing a plurality of effluent streams each containing said components by a				
6	calibration process comprising;				
7	(a-1) advancing at least a portion of each said effluent stream				
8	through a sample cell in a Fourier Transform infrared spectrometer;				
9	(a-2) scanning each said effluent stream advancing through said				
10	sample cell with infrared energy across a range of infrared wavelengths and				
11	obtaining absorbance data at selected wavelengths across said range of				
12	infrared wavelengths;				
13	(a-3) collecting at least one sample corresponding to each said				
14	effluent stream;				
15	(a-4) performing a recovery run analysis on said at least one sample				
16	to obtain quantitative data for each of said components in said at least one				
17	sample; and				
18	(a-5) determining said calibration curve for each of said components				
19	by correlating said absorbance data and said quantitative data;				
20	(b) obtaining real-time absorbance data for each of said components in				
21	an operational effluent from said ammoxidation reactor by performing steps (a-1)				
22	and (a-2) thereon and calculating in a microprocessor programmed therefor real-				
23	time quantitative data for said operational effluent from said calibration curve and				
24	said real-time absorbance data; and				
25	(c) controlling by a reactor controller said ammoxidation reactor to				
26	optimize production of at least one of said components based on said real-time				
27	quantitative data.				
1	19. A method as in claim 18, wherein said calibration is performed in a				
2	microprocessor programmed to prepare said calibration curve.				

A method as in claim 18, further comprising outputting quantitative

21.	A method as in claim 18, wherein said quantitative data is output to
a reactor co	ntroller communicating with said ammoxidation reactor and said reactor
controller is	adapted to adjust and control operation of said ammoxidation reactor
based on sa	aid quantitative data.

- 22. A method as in claim 21, wherein said ammoxidation reactor controller is controlled by said microprocessor.
- 23. A method as in claim 18, wherein said ammoxidation reactor is operated to produce acrylonitrile.
